in a ground breaking series of articles one of them written by a nobel laureate this volume demonstrates the evolutionary dynamic and the transformation of today s democratic societies into scientific democratic societies it highlights the progress of modeling individual and societal evaluation by neo bayesian utility theory it shows how social learning and collective opinion formation work and how democracies cope with randomness caused by randomizers nonlinear evolution equations and serial stochastic matrices of evolutionary game theory allow us to optimally compute possible serial evolutionary solutions of societal conflicts but in democracies progress can be defined as any positive gradual innovative and creative change of culturally used transmitted and stored mentifacts models theories sociofacts customs opinions artifacts and technifacts within and across generations the most important changes are caused besides randomness by conflict solutions and their realizations by citizens who follow democratic laws these laws correspond to the extended pareto principle a supreme socioethical democratic rule according to this principle progress is any increase in the individual and collective welfare which is achieved during any evolutionary progress central to evolutionary modeling is the criterion of the empirical realization of computed solutions applied to serial conflict solutions decisions evolutionary trajectories are formed they become the most influential causal attractors of the channeling of societal evolution democratic constitutions legal systems etc store all advantageous present and past adaptive competitive cooperative and collective solutions and their rules they have been accepted by majority votes societal laws are codes of statutes default or statistical rules and they serve to optimally solve societal conflicts in analogy to game theoretical models or to statistical decision theory such solutions become necessary when we face harmful or advantageous random events always lurking at the edge of societal and external chaos the evolutionary theory of societal evolution in democracies presents a new type of stochastic theory it is based on default rules and stresses realization the rules represent the change of our democracies into information science and technology based societies they will revolutionize social sciences especially economics their methods have already found their way into neural brain physiology and research into intelligence in this book neural activity and the creativity of human thinking are no longer regarded as linear deductive only evolutive nonlinear thinking can include multiple causal choices by many individuals and the risks of internal and external randomness this serves the increasing welfare of all individuals and society as a whole

evolution and progress in democracies is relevant for social scientists economists evolution theorists statisticians philosophers philosophers of science and interdisciplinary researchers

a philosopher subjects the claims of evolutionary psychology to the evidential and methodological requirements of evolutionary biology concluding that evolutionary psychology's explanations amount to speculation disguised as results human beings like other organisms are the products of evolution like other organisms we exhibit traits that are the product of natural selection our psychological capacities are evolved traits as much as are our gait and posture this much few would dispute evolutionary psychology goes further than this claiming that our psychological traits including a wide variety of traits from mate preference and jealousy to language and reason can be understood as specific adaptations to ancestral pleistocene conditions in evolutionary psychology as maladapted psychology robert richardson takes a critical look at evolutionary psychology by subjecting its ambitious and controversial claims to the same sorts of methodological and evidential constraints that are broadly accepted within evolutionary biology the claims of evolutionary psychology may pass muster as psychology but what are their evolutionary credentials richardson considers three ways adaptive hypotheses can be evaluated using examples from the biological literature to illustrate what sorts of evidence and methodology would be necessary to establish specific evolutionary and adaptive explanations of human psychological traits he shows that existing explanations within evolutionary psychology fall woefully short of accepted biological standards the theories offered by evolutionary psychologists may identify traits that are or were beneficial to humans but gauged by biological standards there is inadequate evidence evolutionary psychologists are largely silent on the evolutionary evidence relevant to assessing their claims including such matters as variation in ancestral populations heritability and the advantage offered to our ancestors as evolutionary claims they are unsubstantiated evolutionary psychology richardson concludes may offer a program of research but it lacks the kind of evidence that is generally expected within evolutionary biology it is speculation rather than sound science and we should treat its claims with skepticism
